Systems in Emergent Digital Practices (S2020)

Date

Hypertext (collaboration)**Description:**

Group collaborative creative coding project; networked and web-based.

Now that we've established histories, concepts, themes, it is time to reflect and expand on your individual and shared understanding of systems in dialogue with group members,

Each member of the team/group must contribute (*minimum*) five HTML Pages. Each page should include (*minimum*): image, text, and meaningful links to other group members' pages as well as external links and sources.

The website (collection of pages) should be themed. The theme should be developed as a group and apparent throughout the site, in its aesthetic and structure.

It is likely that different team members will have different ideas of what is most important and what the focus of the project should be. Luckily, this format provides an opportunity to meaningfully link and interrelate these themes and ideas.

Deliverables: (on [GitHub Pages](#) and as a ZIP file from *one* group member)

All assets for your project:

(*minimum*) five HTML files for each member of the group, in individual folders all images and other assets in a dedicated folder.

HTML files should include member name, and simple meaningful title.

(ex. phillips-mindandnature.html)

be sure to append this to your files on GitHub to view them in-browser <https://htmlpreview.github.io/>

Brief in-class presentation showing your working project, presented as a group and accessible to the class..

(individually, on Canvas)

Text reflection, @300 words, briefly addressing the theme(s) of your group's project overall, as well as those of your individual contribution, also describing your perspectives on your group project and addressing difficulties, what went well, what you would do differently next time, addressing contributions from other members, and so on.
